

vSOC

**Ingalls Virtual Security
Operations Center Services**

Ingalls Virtual Security Operations Center (vSOC) services combines the very latest in Cloud and Data Analytics technology coupled with the cyber security industry's leading incident response team to identify potential incidents on your network. Our vSOC offerings are determined by breadth of coverage, scope of monitoring, and our engagement levels.

Our vSOC is designed for advance detection and threat hunting.

Real Time Network Security Monitoring

Only a handful of people in the nation have fought and won against both nation states and criminal hacker collectives and several of these individuals work for us. Our solution combines the very latest in Cloud and Data Analytics technology coupled with the expertise of the cyber security industry's leading incident response team. Our analysts are called in and succeed when the other fail.

Incident Response and Breach Remediation

Even with the best controls in place, a security incident can still happen. Whether your incident is the result of a hacker, malware, or a negligent employee, Ingalls Information Security is prepared to respond quickly to security incidents. Our certified security and forensic experts can help you contain the situation and determine your next steps.

Comprehensive Security Consulting and Planning

We work to develop security programs from the ground up or to enhance existing security programs, IT infrastructure and internal security teams. Our approach to corporate governance, enterprise risk management, and corporate compliance (GRC) aligns information technology and security to business operations.

Training

Cyber breaches have become a part of our everyday lives and savvy organizations are evolving to better protect themselves and minimize the impact of a breach on their business. Ingalls Information Security has been involved in and coordinated the Incident Response plans for some of the largest security breaches known.

Who We Are

Ingalls Information Security is a specialized, cyber defense company with a mission to prevent and respond to data security breaches. We have responded to some of the largest data breaches in history. In addition, we provide consulting services to the Federal Government, financial institutions, national retail chains, as well as to non-profit organizations. The experience and knowledge we gain while working on data security breaches sets us apart. We have seen and have countered the tools and tactics used by criminals and by state-sponsored hackers. Our goal is simple, to use our experience and knowledge to help our customers protect their data.

Leveraging Years of IR Experience to Provide Real-Time Analysis

Ingalls' consultants, analysts, and engineers are certified and experienced professionals with diverse backgrounds including military and defense intelligence, network security, and information technology. Ingalls vSOC is designed to complement client operations with analysis, forensics, engineering, consulting and incident response services that traditional security controls cannot provide. We become your trusted partner, a member of your team, to neutralize threats before they become incidents.

Cloud-Based Infrastructure Allows for Dynamic Scaling of Services to Fit Your Security Needs.

Ingalls is product agnostic and can take feeds from any of your devices, including existing SIEM solutions. Our infrastructure allows all client data to stay within its environment. Our planning and implementation during onboarding establishes measures to ensure the client maintains control over all sensitive data at all times.

Active Defense

Our analysts take an active and involved role in identifying and countering threats to the network and its systems. Ingalls deploys "active threat monitoring" that goes far beyond the traditional alert model of the past. We actively hunt for attackers in your network by utilizing advanced threat hunting techniques coupled with real-time threat intelligence to detect network incidents that may evade traditional security solutions.

viewpoint™

We leverage the only patented proprietary (VR) technology, viewpoint™ to intuitively analyze in real-time, network connections across the world. viewpoint™ is a solution that allows analysts to interact with data using mixed reality interfaces and consume vast amounts of data compared to today's inefficient, spreadsheet-based data interfaces. It creates a valuable capability for time-sensitive analysis in cybersecurity operations.
